Letter Report
Groundwater Sampling and Well Destruction, Well TMW-17
Boeing C-6 Facility
Los Angeles, California

Dear Mr. Stavale,

INTRODUCTION

Harding Lawson Associates (HLA) is pleased to submit this letter report to Boeing Realty Corporation (BRC) regarding the gauging, sampling, and destruction of temporary groundwater monitoring well TMW-17 located at the Boeing C-6 facility, 19503 South Normandie Avenue, Los Angeles, California. The objective of this project was to provide sampling and destruction of Well TMW-17 according to the December 1998 Sampling and Analysis Plan approved by the California EPA, Department of Toxic Substances Control (DTSC) and guidelines of the Los Angeles Department of Health Services (DHS), respectively. This letter report describes the field activities that were performed and presents the analytical data for this project as outlined in HLA's proposal/workplan dated January 11, 2000.

FIELD ACTIVITIES

The field activities included gauging and collecting the required groundwater samples, transporting the samples to the analytical laboratory, the destruction of monitoring well TMW-17, and the storage, removal, and disposal of all wastes generated at the site. A description of the field activities is presented below:

Groundwater gauging, sampling, and analysis

Temporary monitoring well TMW-17 was gauged and sampled on January 14, 2000. Gauging was accomplished using an electronic water level meter. Air monitoring for volatile organic compounds was performed with a photoionization detector (PID) upon opening the well cap. After the well was gauged, approximately five well volumes of groundwater were purged using an electric submersible pump. The groundwater was monitored for field parameters including temperature, pH, turbidity, and electrical conductivity during purging. A field log was maintained to document these parameters and is included in Appendix A.

A groundwater sample was collected for chemical analysis after purging the well. The sample was collected using a new, disposable polyethylene bailer equipped with a low-flow bottom-emptying device. The sample was decanted into two 40-ml VOA vials and one 500-ml polyethylene bottle to be analyzed for trichloroethene (TCE) by EPA Method 8260 and for hexavalent chromium by EPA Method 7196, respectively. The fraction for Chromium VI analysis was prepared by filtering in the field using a peristaltic pump and a disposable 0.45-micron filter.

The sample was transported for testing on the day of collection via courier to Orange Coast Analytical, Tustin, California, a state-certified laboratory. The sample was transported in a chilled ice under chain-of-custody protocol. Laboratory test results and chain-of-custody documentation for the groundwater sample is included in Appendix B.

Harding Lawson Associates

New drinking-water grade polyethylene tubing was used to purge the well. All non-disposable sampling equipment was decontaminated before each use with an Alconox detergent wash and double rinse with distilled water. The submersible pump was decontaminated by placing the pump in a container and pumping 20 gallons of potable water through it, and then rinsing again with distilled water. Decontamination fluids were stored in a 55-gallon drum for disposal after profiling.

Well Destruction

Temporary monitoring well TMW-17 was destroyed on January 19, 2000. The well was destroyed by overdrilling the well casing, screen, grout, and sand pack using eight-inch diameter hollow stem auger equipment operated by THF Drilling of Fontana. After overdrilling, the boring was pressure-backfilled through the augers in 20- to 30-foot lifts from total depth to approximately 15 feet below ground surface (bgs) with a Portland cement/water mixture and a one-inch diameter tremie pipe. The upper 15 feet of the borehole was backfilled with ready-mix concrete to the ground surface. All drilling equipment was decontaminated before each using a steam cleaner. An HLA geologist was present to supervise the destruction of the monitoring well. A PID was used for health and safety air monitoring during drilling. Field logs were maintained to document all field activities. The following is a tabulation of overdrilling and backfilling observations for the destroyed well:

Overdrilling Observations	TMW-17
Original Depth of Well (height above ground), feet	82 (2)
Depth of Overdrilling, feet	83
Blank Casing Removed (condition), feet	64 (intact)
Screened Casing Removed, feet	20 (intact)
Auger Depth Before Cuttings Observed, feet bgs	25
Grout Removed, cubic yards	1.4
Bentonite- Grout/Sand Mix removed, yards	0.6
Backfilling Observations	
Backfill Mixture, Portland (bags)/Water (Gallons)	4/30
Total Quantity of Portland Used (bags)	30

During overdrilling of the well, grout cuttings were not observed at the surface until the augers reached a depth of 25 feet bgs (see above table). In discussions with the drilling contractor they maintained that for wells backfilled with bentonite grout, which does not set up like Portland cement, it is uncommon to observe cuttings at the surface until a significant portion of the well has been overdrilled. The reasons for this are the smaller relative volume of material being overdrilled (grout only occupies annular space between PVC casing and borehole wall) compared to drilling in undisturbed ground and that the fluidity of the grout does not allow it to readily travel up the auger flights. A HLA registered geologist observed and photographed remaining wells BL-1 through BL-4 to check if significant settlement of the grout had occurred. The photographs, included in Appendix A, show that there was little to no settlement of the grout at each of these wells. We therefore do not believe that the bentonite grout underwent significant settlement at Well TMW-17.

Waste storage, hauling, and disposal

Purge and decontamination water from the groundwater sampling and well abandonment activities was stored in a 55-gallon drum. Waste from the well destruction activities (well materials, sand pack, sealing materials) was contained in a roll-off bin.

Three composite waste profile samples, two soil (SP-1 and SP-2) and one wastewater (WWP-1), were collected at the end of the investigation to be analyzed by EPA Method 8260, EPA Method 418.1, EPA Method 8082, and for Title 22 CAM Metals. The waste samples were transported for profiling on the day of collection (January 19, 2000) via courier to BC Analytical in Bakersfield, California, a state-certified laboratory. The samples were handled and transported in a chilled ice chest under chain-of-custody protocol.

Upon receipt and evaluation of the analytical profiling test data, all wastes were removed from the property for disposal as non-hazardous material. The waste soil was disposed at Filter Recycling Services in Rialto by Consolidated Waste Industries, Montclair, California. The wastewater was disposed at the Crosby & Overton facility in Long Beach by Cameron Environmental, Torrance, California. Non-hazardous waste data forms for disposal of the waste are included in Appendix C.

RESULTS

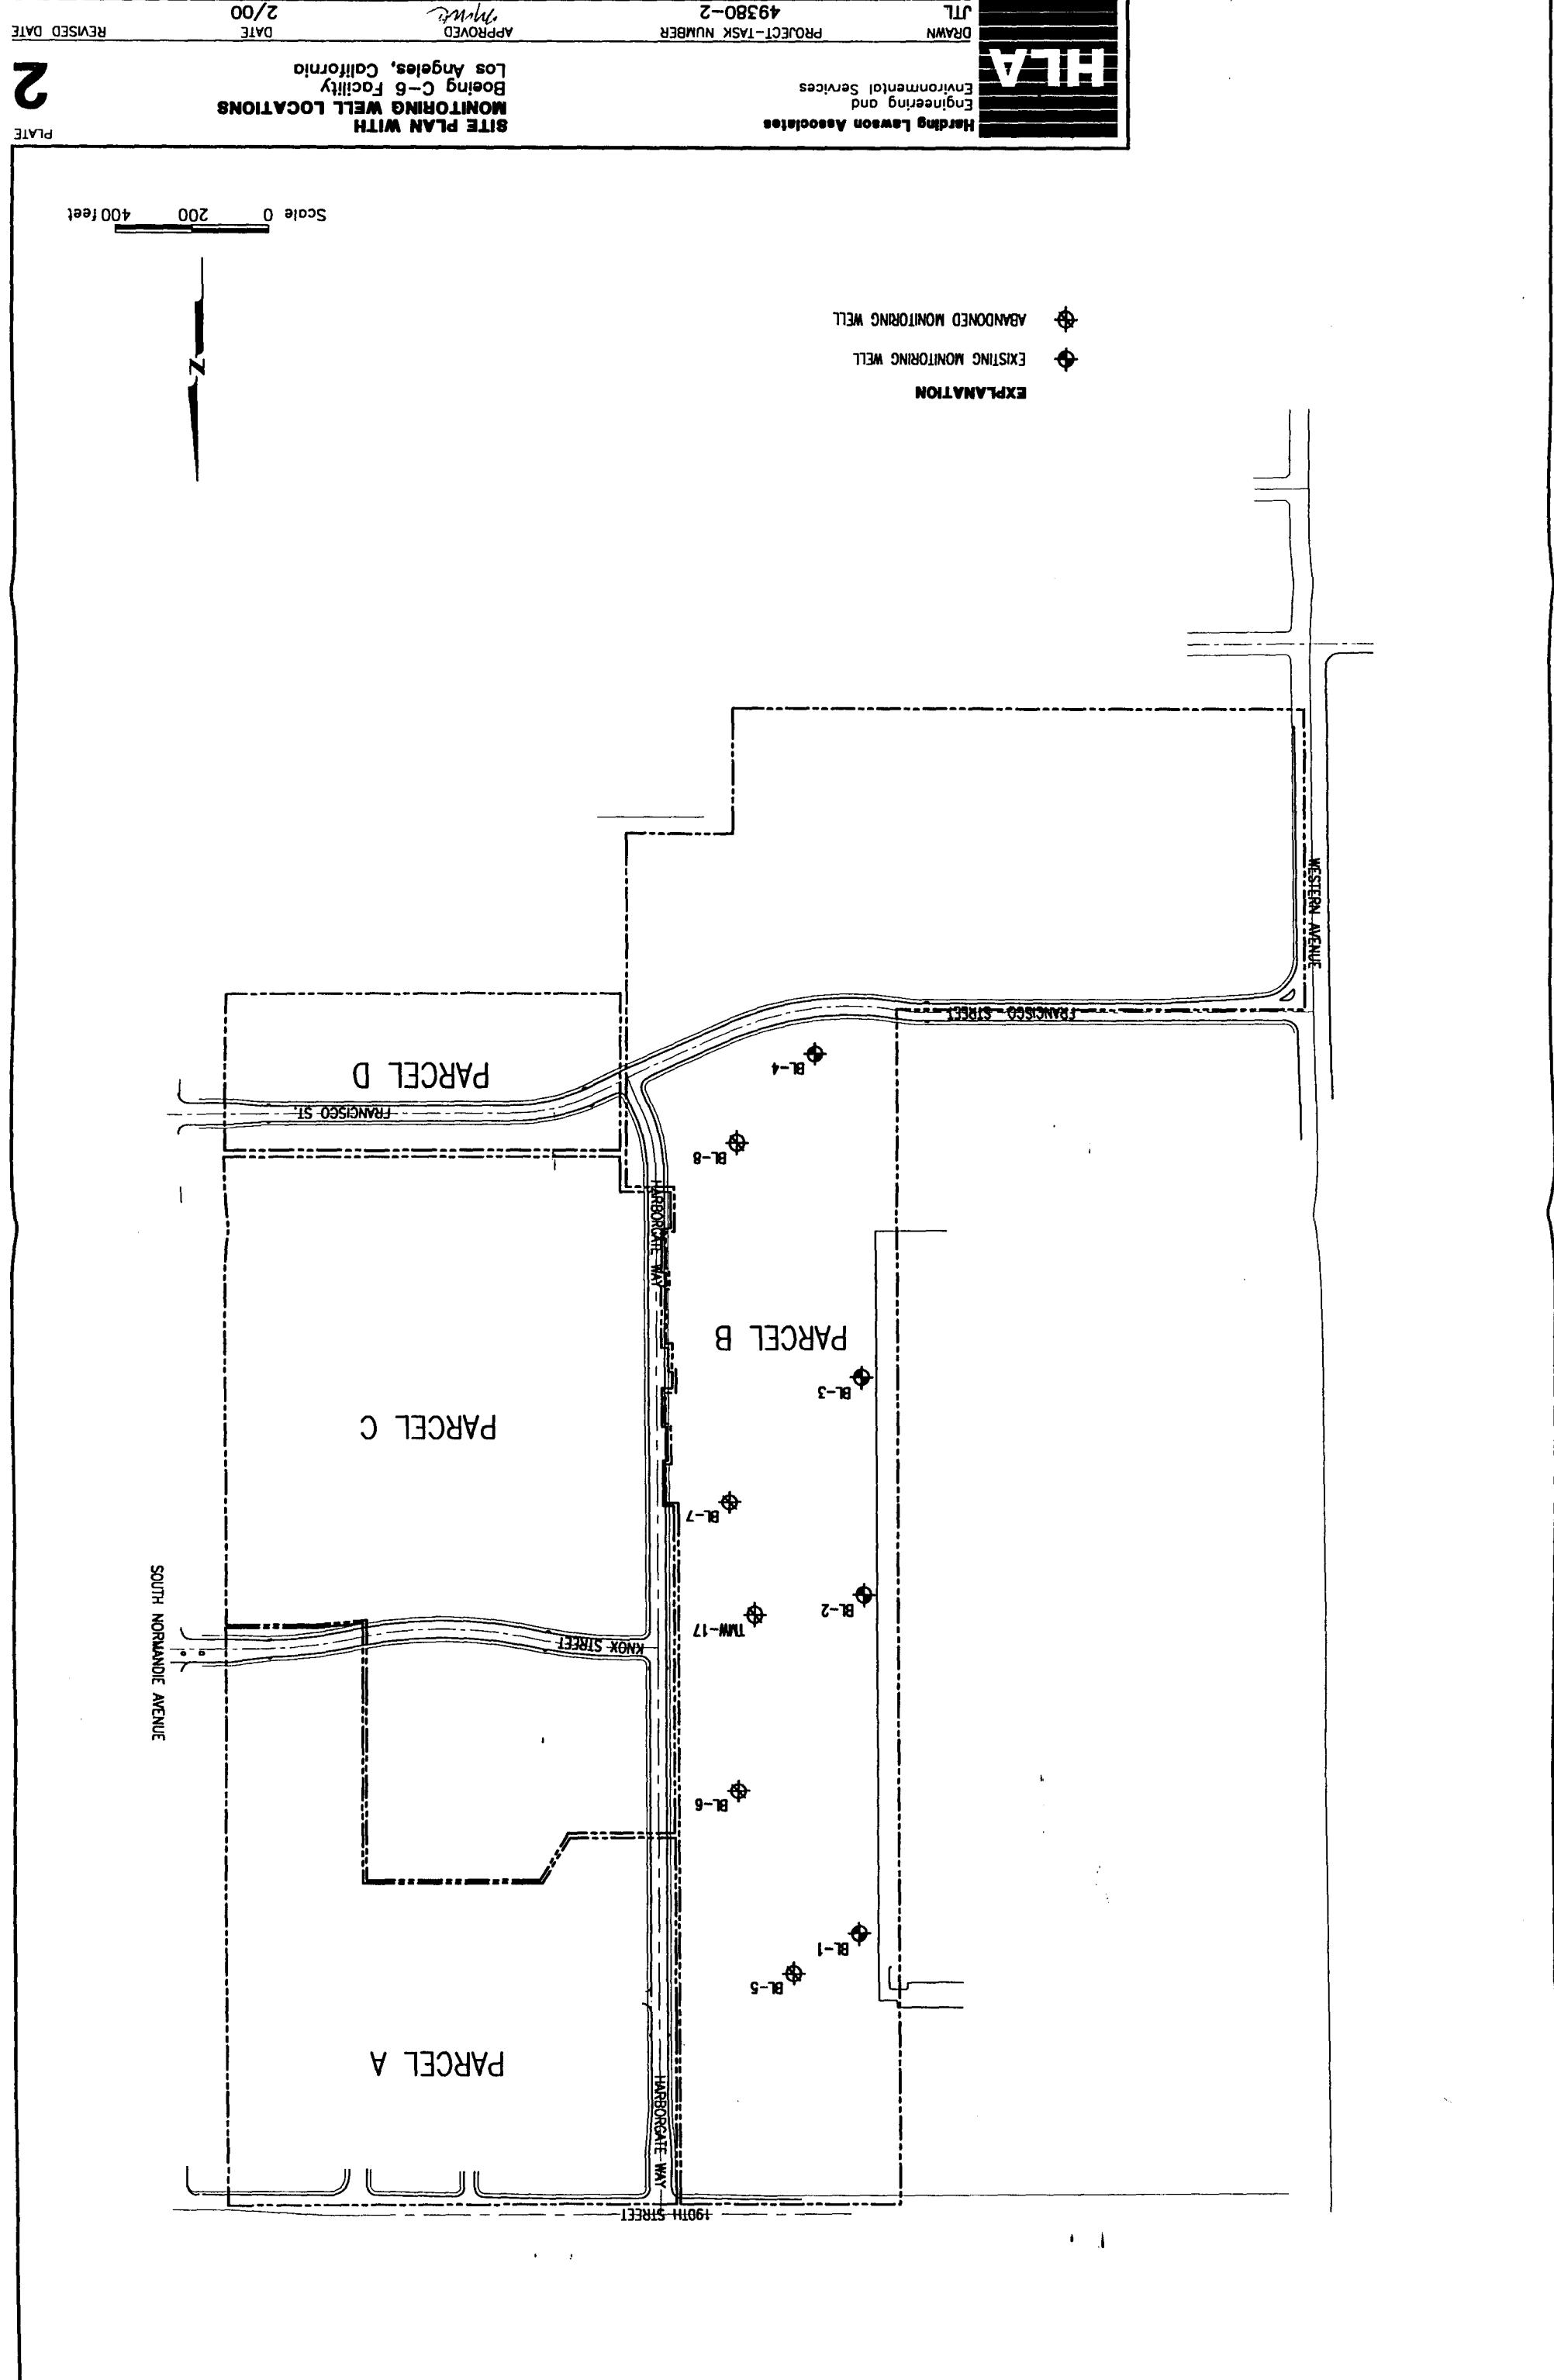

The results of the groundwater level gauging, groundwater sample analyses, and waste soil and groundwater profile sample analyses are presented in the following tables:

Groundwater gauging and purging

Well No.	Top of Casing Elevation (feet MSL)	Depth to Water (feet btoc)	Groundwater Elevation (feet MSL)	Volume of Water Purged (Gallons)	Headspace PID Reading (ppm)
TMW-17	55.54	68.95	-13.41	13	0

TOTAL CONCENTRATIONS

(California Code of Regulations, Title 22, Section 66261)

Harding Lawson and Associates
2171 Campus Dr., Suite 100
Irvine, CA 92612
Attn: MARK CLARDY 909-888-1690

Date Reported: 02/10/2000
Date Received: 01/19/2000
Laboratory No.: 00-00785-3

Sample Description: 49311.00.1, BOEING, SP-2, 01/19/2000 a 11:00, KEN

Comment: All above constituents are reported on an as received (wet) sample basis.
Results reported represent totals (TTLC) as sample subjected to appropriate
techniques to determine total levels.

P.Q.L. = Practical Quantitation Limit (refers to the least amount of analyte
quantifiable based on sample size used and analytical technique employed).

STLC = Soluble Threshold Limit Concentration

TTLC = Total Threshold Limit Concentration

REFERENCES:

SW = "Test Methods for Evaluating Solid Wastes Physical/Chemical Methods", EPA-SW-846.

Flag Explanations:

- ** = Sample precision is not within established limits.
Matrix spike recovery/precision not within established limits. Results
may be biased.
- *04 = Matrix spike recoveries not within established limits, results may be affected.
- *05 = Sample precision is not within established limits.
- *31 = Matrix spike recoveries not within established limits, results may be biased.
Sample precision is not within established limits.

2171 Campus Dr., suite 100

Irvine, CA 92612

MARK CLARDY

Samples Affected: 00-00785-2, 00-00785-3

MS = Matrix Spike; MSD = Matrix Spike Duplicate; RPD = Relative Percent Difference

The sample RPDs for barium, chromium, copper, mercury, vanadium, and zinc
the spike RPDs for mercury and silver, and the matrix spike recoveries
for barium, cadmium, mercury, nickel, and silver are outside QC limits.
The sample report is flagged accordingly.
